# How to Take a Screenshot on Any Device

Here's everything you need to know about capturing screenshots, no matter the platform—Windows, macOS, Chrome OS, iOS, Android, and even Linux.

By [Jason Cohen](#) Updated June 10, 2020 [f](#) [t](#) [...](#)

## Screenshots in Web Browsers

If you need to preserve what you're seeing on your phone or computer screen, mobile and desktop operating systems offer robust screen-capture tools. Most tools are built-in, but there are a wealthy of third-party options, as well as browser extensions that also do the job. Here's how to take a screenshot on Android, [Chrome OS](#), iOS/iPadOS, Linux, macOS, and Windows.

## How to Take a Screenshot on iPhone or iPad

If you own an Apple device that still has a Home button (like the 2020 iPhone SE), hold down the sleep/wake button and press the Home button to take a screenshot. You will hear a camera shutter (if your sound is on) and see a "flash" on the screen. The screenshot will then appear in your Camera Roll and in the Screenshots album.

For devices without a Home button—the iPhone X and iPhone 11 lines, iPhone XR, and iPad Pro—hold down the side button to the right of the screen (top button for iPad Pro) and the volume up button at the same time.

An advertisement for fairlife Light Ice Cream. On the left, the text reads "new fairlife LIGHT ICE CREAM now in the freezer aisle". In the center, three ice cream tubs are displayed: vanilla, cookies &amp; cream, and mini chip. On the right, the text says "Find NEW fairlife light ice cream, in Walmart" with the Walmart logo. Below this is a dark blue button with a white location pin icon and the text "Find A Store".

If you're using an Apple Pencil with iPadOS, you can take a screen grab with the drawing tool. Simply swipe up from the bottom corner of the screen with the Apple Pencil to capture the image. You can also choose between just your current screen or the entire page, even after the picture has been taken.

If you need to annotate a screenshot, tap the small thumbnail that appears at the bottom of the screen once you capture a screenshot. This will open the device's markup tool and allow you to edit the screengrab.

Some apps may make it difficult to take screenshots through the normal means. This is where your device's built-in Screen Recording tool comes in. While its primary purpose is to record video of your screen, you can pause the video and take a screenshot this way.

You can also use a third-party tool to capture the screen of your mobile device from a computer. With the LonelyScreen tool, you share your screen via AirPlay and record or take screenshots of anything on your mobile device's screen from the computer. Apowersoft's iPhone/iPad Recorder can work as long as the PC and mobile device are on the same Wi-Fi network. Activate the AirPlay connection in Control Center, then record video and stills on a computer.

## How to Take a Screenshot on Android

Android devices are not as uniform as iPhone and iPad, so screenshot commands may be different depending on the phone's manufacturer. Most Android devices should be able to take screen grabs by holding down the **power and volume down buttons**, though holding the **power and home buttons** (if your device has a physical button) may also work. Devices running Android 10 can also hold down the power button, then select Screenshot from the menu.

Several Android devices also have a screenshot button in the pull-down Quick Settings menu. If your phone has Google Assistant or Bixby (Samsung), you can use a voice command to ask the voice assistant to take a screenshot for you. For Samsung devices with the S Pen stylus, you can take a screen grab from the Air Command menu by tapping Screen Write. You can then write on or crop the image.

Buttons on the Google Pixel 4

Samsung phones also support gestures to take screenshots. Navigate to the screen image you like, position your hand like you plan to karate chop the phone, then swipe the entire side of your hand along the screen from right to left. Set this up (or turn it off) in **Settings > Advanced Features > Palm swipe to capture**.

No matter what device you have, all Android users can download third-party apps to take screen captures. Many apps meant for recording video can also take screenshots. Screenshot Easy is a top-rated option that uses the same basic triggers as Android itself; you can also customize it and take a screenshot just by shaking your phone.

To take screens of what's transpiring on your Android device on a PC, check out Apowersoft's Android Recorder. The app lets you cast your phone or tablet screen to a Windows or macOS machine for easy capture of stills and video. It requires Android 5.0 and above.

## How to Take a Screenshot on Apple Watch

Did you know you can take a screenshot of your Apple Watch screen? First, the feature must be enabled. Open the Watch app on your iPhone or iPad, and navigate to **My Watch > General > Enable Screenshots** and toggle it on.

Take a screenshot on an Apple Watch by pulling up the screen you want to capture. Hold the Side Button and click the Digital Crown simultaneously. Like on iPhone, the screen will "flash" white and the camera shutter will go off. The screenshot will then appear on your iPhone Camera Roll, not the watch itself.

## How to Take a Screenshot on Wear OS

If you have a smartwatch made by Fossil, Huawei, Motorola, or Samsung, it runs on Google's Wear OS. Taking a screenshot on your Wear OS device is now much easier than it used to be because you use an app on your phone to do the work.

Open the Wear OS app, hit the three-dot menu and choose **Take screenshot of watch**. You will receive a notification on your phone allowing you to save or share the image via the supported apps.

## How to Take a Screenshot in Windows 10

The simplest way to take a screenshot in Windows is to use the Print Screen button. You'll find it on the upper-right side of most keyboards. Tap it once and it will seem like nothing happened, but Windows just copied an image of your entire screen to the clipboard. You can then hit Ctrl+V to paste it into a program, be it a Word document or an image-editing program.

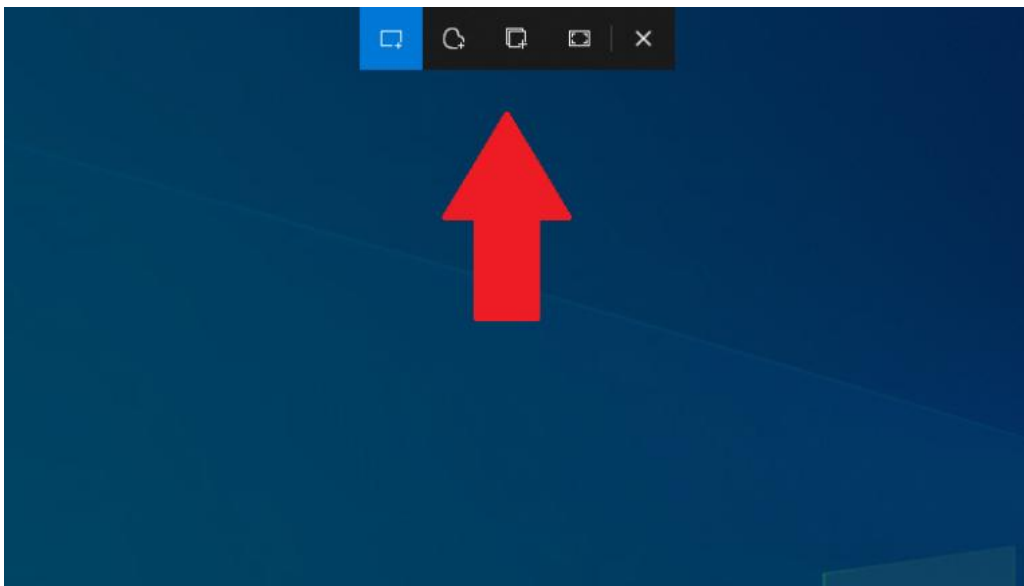

ADVERTISEMENT

The problem with this method is it captures everything visible on your monitor, and if you have a multi-monitor setup, it will grab all the displays as if they're one big screen. You can narrow things down with Alt+Print Screen, which will capture just the window you currently have open.

Windows also has multiple built-in tools that can help you take more precise screen grabs. The Snipping Tool can be found in the Start menu, which will provide a small toolbar to capture multiple types of screenshots. Grab just the area you want with a rectangular capture area, select a specific window to capture, or get the entire screen in one shot. Once a screenshot is taken, it is moved to the Snipping Tool editor, where you can save and edit the image.

Another option is Snip & Sketch, which was introduced with the [Windows 10 May 2019 update](#) and is expected to eventually replace the Snipping Tool. Launch this program by using the Shift+Windows Key+S keyboard shortcut. This will launch a small toolbar at the top of the screen so you can easily choose what to capture.

One more built-in option for screen grabs is the [Windows Game Bar](#). Though it is intended to record gaming sessions, it can be used to record any action and capture screen grabs. Open the tool with Windows Key+S

and tap the camera button in the **Broadcast & capture** section to save a screenshot to the Videos/Captures folder under your main user folder.

If all that fails, Windows has an array of third-party screen-capture utilities available. The best option is [Snagit](#), which costs a whopping \$50. Of course it'll do everything you can imagine, even take video of what's happening on your screen.

You can find plenty of screenshot apps for free, though. [Jing](#), by the makers of Snagit, also does screencast videos and makes sharing what you capture easy. [LightShot](#) is a nifty and small utility that takes over the PrtScr key and makes it easy to capture and share.

## How to Take a Screenshot on Mac

Following the update to Mojave, Mac users now have more control over [grabbing screenshots](#) than ever before. The update introduced a screenshot tool that can be triggered by pressing Command+Shift+5, or by navigating to **Launchpad > Other > Screenshot**.

The screen capture window allows you to perform different actions. Choose to capture the entire screen, part of the screen, or a specific window. You can also capture video of the entire screen or just a portion of it, and there's also the option to take screenshots on a timer and change where images are saved.

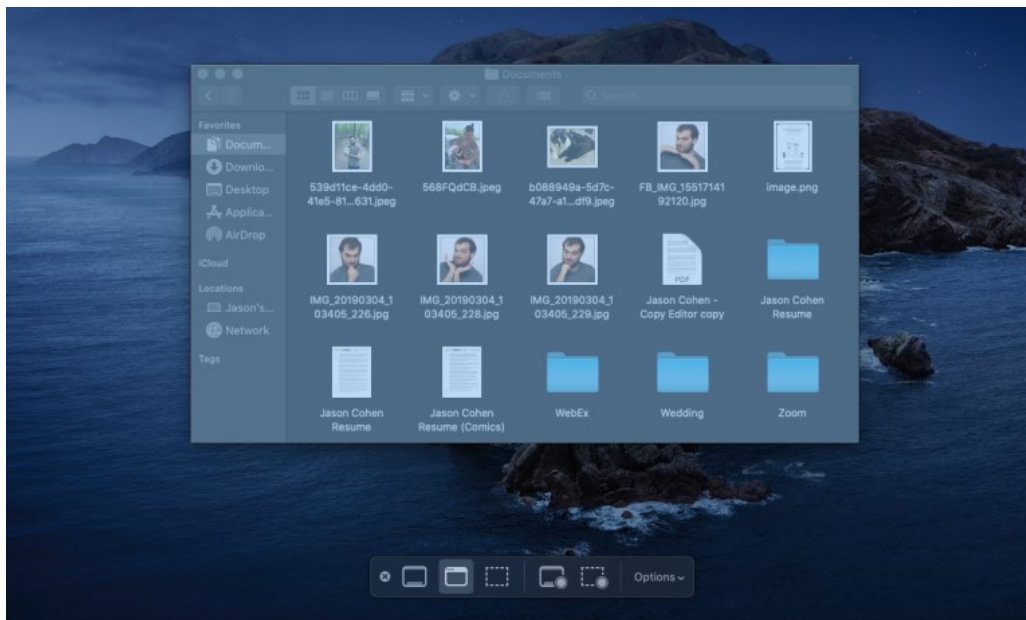

For those who prefer keyboard shortcuts, those are still supported. Use Command+Shift+3 to capture the entire screen. If you only want part of the screen captured, Command+Shift+4 will turn the cursor into a cross-hair. Select the section of the screen you want to capture.

If you want to capture a specific window, use Command+Shift+5 (the same shortcut to trigger the screenshot tool). You can then hit the Space Bar to switch between capturing a section of screen and a specific window. If you have a Mac with a Touch Bar, you can capture it by pressing Command+Shift+6.

If you prefer to capture an image to the clipboard instantly, add Control to any keyboard shortcut you use. For instance, use Command+Shift+Control+3 to capture the entire screen, or Command+Shift+Control+4 for a specific section. The image won't save to the computer, but it can be pasted into an app.

If you've got a Mac with Retina display, a screenshot of the entire screen can be huge in PNG format—as big as 7MB. If you'd rather the Mac save in JPG or some other format, change the settings. You need to open a terminal window on the Mac in question and type:

```
defaults write com.apple.screencapture type jpg
```

Enter your password if asked, then restart the computer and future screenshots should save in the preferred format you specified. You can always change it back by typing the above command with PNG at the end instead.

If you prefer a third-party solution, options like [Snappy](#) (which can sync screenshots with the [SnappyApp](#) for iOS), [Jing](#), [Snagit](#), [Skitch](#), [LightShot](#), and others are available.

## How to Take a Screenshot on Linux

There are almost as many ways to take a screenshot in Linux as there are flavors of Linux. Focusing on Ubuntu in particular, open the Activities menu and select Screenshot. You can then choose between the whole screen, a single window, or a custom area before snapping an image.

Linux also allows you to use the Print Screen button, as well as the Alt+Print Screen shortcut to screenshot a specific window. Use Shift+Print Screen to select a custom area to capture. You can also add the Ctrl key to any shortcut and save the image to the clipboard.

The program GIMP (GNU Image Manipulation Program) allows you to take a screenshot from the same program where you edit the image after it's captured. Open GIMP and go to **File > Acquire > Screen Shot**. You'll get a few options, such as taking the entire screen, a window, or using a time delay. The captured image then opens in GIMP for editing.

## How to Take a Screenshot on Chromebook

If you own a Chromebook, you can take a screenshot with help from the laptop's Window Switch Key. This button is located at the top of the keyboard and has an image of a box with lines next to it. Hit Ctrl+Window Switch Key to take a full-screen snapshot. You will see the notification on the lower right of the screen.

ADVERTISEMENT

Enter Ctrl+Shift+Window Switcher to get just a section of the screen. The cursor becomes cross-hairs you can use to select what you'd like to capture.

If you're using a standard keyboard—not a Chromebook keyboard—you won't see a Window Switcher button. You'll need to Ctrl+F5 and Ctrl+Shift+F5 instead. When using your Chromebook in tablet mode, you can take screenshots without the use of the keyboard. Press the power and volume down buttons to snap a picture, though this method can only be used to capture the entire screen.

All the images are saved as PNG files on the computer's local Downloads folder. If you wish to preserve these screenshots permanently, you must upload them to [Google Photos](#) or back them up in [Google Drive](#).

Since 90 percent of what you do on a Chromebook probably takes place in the Chrome web browser, you can also utilize a number of Chrome extensions.

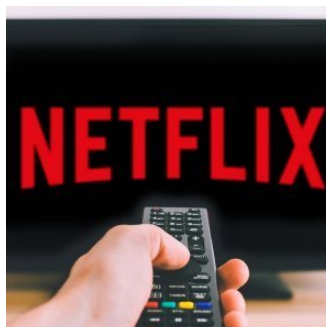

## Screenshots in Web Browsers

Chrome, Firefox, Safari, and Edge all support add-ons that extend browser usability. Here are a few programs you can download that have browser extensions. Use these add-ons to put screen-capture utilities right into the browser.

- **[LightShot](#)** is free and works on Windows and Mac, but can also be added as [Chrome](#) and [Firefox](#) extensions.
- **[FireShot](#)** is a paid (\$59.95) capture program that works with a browser or email client. It will capture and allow instant edits, sharing via social media, or instant saves to the computer. There are also [Chrome](#), [Firefox](#), and [Edge](#) extensions
- **[Awesome Screenshot](#)** is a free program that captures a whole page or a section, and then quickly annotates it (or blurs out the naughty bits) before sharing instantly. There are extensions for [Chrome](#), [Firefox](#), and [Edge](#).
- **[Nimbus Screen Screenshot](#)** is free and will let you capture the whole screen or just parts of it. You can also use it to draw, make annotations, or mark up those same images. There are [Chrome](#) and [Firefox](#) extensions.
- **[Page Screenshot](#)** is a paid (\$2.99) extension for Safari users that can capture the full length of a website or just a specific section. Once a screen grab is taken, the program opens Preview for easy editing.
